EDUCATION

SRM University, AP <i>B.Tech. Computer Science and Engineering (CGPA: 8.40)</i>	2024 – 2028 Amaravati, India
VidyaGyan School (CBSE) <i>Higher Secondary: 88.4% Secondary: 95.4%</i>	2020 – 2024 Sitapur, India

EXPERIENCE & OPEN-SOURCE CONTRIBUTIONS

OpenSearch (Linux Foundation / AWS) <i>Open Source Contributor — Go SDK & API Specification</i> - Refactored the OpenSearch Go SDK (<code>opensearchutil</code>) bulk indexing pipeline by replacing a single channel with worker-partitioned channels to eliminate thread contention under heavy workloads. - Implemented deterministic document-level routing using shard hashing (<code>hashValue % NumWorkers</code>), ensuring sequential processing of updates per <code>documentID</code> and preventing out-of-order write conflicts. - Engineered a lock-free round-robin fallback mechanism for unkeyed records and resolved JSON deserialization exceptions in OpenAPI client generators for the <code>analyze</code> API.	Nov 2024 – Present Remote 🌐
Chorus & Quepid (OpenSource Connections) <i>Open Source Contributor — Search Relevance & Telemetry Tooling</i> - Resolved session persistence and User Behavior Insights (UBI) telemetry drops in the Chorus e-commerce search platform by implementing persistent storage sync for analytics identifiers. - Modernized legacy search diagnostic interfaces across Quepid and Chorus to React 18, refactoring deprecated protocol routing logic and streamlining multi-container Docker environments.	Dec 2024 – Present Remote 🌐

TECHNICAL SKILLS

Languages:: JavaScript (ES6+), Python, Go, C/C++, SQL, HTML5/CSS3
Frameworks:: React.js, Node.js, Express.js, FastAPI, Tailwind CSS, Bootstrap
Databases:: MongoDB, MySQL, PostgreSQL
Tools & Cloud:: Git, GitHub, Docker, Playwright, Linux/Unix, CMake, Firebase
Core Concepts:: Data Structures & Algorithms, Multi-threaded Systems, Concurrency, REST APIs

TECHNICAL PROJECTS

VulnPulse: Async Vulnerability Scanner (FastAPI, Python, Playwright, React 19) 🌐 - Architected an asynchronous FastAPI backend utilizing SQLAlchemy and background task scheduling to execute multi-stage audit pipelines with strict host scope validation and rate-limiting. - Optimized heuristic crawling algorithms across dynamic client-side routes, cutting scan discovery latency while maintaining zero off-target perimeter bleed.
Mini-Redis: Concurrent Key-Value Store (C++, POSIX Threads, CMake) 🌐 - Built a thread-safe, multi-client key-value store using POSIX sockets and a custom thread pool to efficiently handle concurrent client requests. - Implemented an LRU caching mechanism and Reader-Writer Locks to optimize memory usage and ensure safe concurrent access without data races. - Developed an Append-Only File (AOF) persistence mechanism for crash recovery, along with a custom Redis-like command parser for extensible operations.
Doodle.io: Real-Time Collaborative Canvas (React, Node.js, Socket.io) 🌐 - Engineered a real-time collaborative drawing platform utilizing HTML5 Canvas and Socket.io for low-latency, bidirectional state synchronization across multiple concurrent clients. - Designed a scalable Node.js/Express backend to handle room-based session management, live broadcasting of drawing coordinates, and responsive client-side rendering.

CERTIFICATIONS & ACHIEVEMENTS

Winner — VibeCraft Hackathon: Developed a decentralized application on the QUAI Network.	
MongoDB Associate Developer (Node.js) — Certified in database modeling and aggregation pipelines	2026
Deloitte Cyber Security Experience — Completed threat identification and perimeter analysis simulation	2024
